DENNIS KIPNGETICH

AI Safety & LLM Evaluation Specialist | AI Red Teaming | Adversarial Testing | Prompt Engineering | Safety & Policy Evaluation

Professional Summary

AI safety and LLM evaluation specialist with 8+ years in AI data operations, human-feedback workflows, and quality assurance. Has conducted adversarial testing and red-team evaluation of LLMs across multiple AI projects to surface guardrail weaknesses, safety failures, and edge cases that standard prompts miss. Evaluates model outputs for safety violations, policy compliance, hallucinations, inappropriate confidence, and instruction-following failures, and documents findings as clear, evidence-based rationales for quality and model-development teams. Holds the Certified AI Security Professional (CAISP) credential and is completing a Master's in Artificial Intelligence. Level 5 Calibrator with approximately 93% average performance across 18 evaluated tasks.

Core Skills

- AI red teaming: adversarial testing (policy evasion, harmful-content elicitation, bias probing, hallucination traps), failure-mode identification, behavioral edge-case analysis, guardrail and safety-weakness discovery
- Safety and policy evaluation: safety evaluation, policy compliance, trust and safety judgment, risk identification and escalation, model alignment evaluation
- LLM evaluation: response rating and pairwise ranking, hallucination detection, factuality and reasoning assessment, instruction adherence, cross-model comparison
- Reporting: structured, evidence-based written findings; documentation of ambiguous and recurring failure cases; rubric and guideline refinement input
- Quality assurance: calibration, inter-rater reliability, disagreement resolution, secondary review of peer work, quality auditing
- Multilingual and cultural review: Swahili, English, French; cultural appropriateness and naturalness checks
- Prompt injection and jailbreak testing: direct and indirect prompt injection, jailbreak and evasion testing
- Agentic and application security: RAG, enterprise API, and tool-calling testing; data-exfiltration escalation
- Multimodal risk testing: content-injection risk across handwriting, image, text, and audio

inputs
- Failure documentation: reproducible failure documentation, escalation of high-risk findings
- AI model evaluation and reasoning analysis: LLM behavior evaluation, reasoning analysis, logical consistency review, risk and decision logic analysis, AI response quality assessment
- Scenario design and testing: real-world scenario simulation, stakeholder perspective analysis, operational feasibility testing, edge-case identification, scenario variation development
- Prompt engineering and AI training: prompt design and optimization, instruction alignment testing, multi-turn dialogue evaluation, response refinement
- QA and evaluation frameworks: structured rubric development, side-by-side model evaluation, A/B testing, model benchmarking, error analysis
- Data annotation and multimodal review: text, image, and multimodal data annotation, content classification, dataset validation

Professional Experience

Independent AI Safety & Evaluation Consultant | Remote | May 2024 – Present

Provide concurrent, contract-based AI red teaming, adversarial testing, and multimodal LLM evaluation services for enterprise AI deployment platforms.

Project: Argos Multilingual (AI Linguistic Annotation Specialist) – July 2025 - September 2026

- Reviewed and corrected linguistic annotations for AI-training datasets; applied detailed guidelines and QA checks and documented difficult edge cases for downstream review.
- Verified and re-annotated 264,000 words of English literary text for accurate character-dialogue identification, boundary precision, and consistent tag alignment; corrected AI-generated dialogue spans so quotation marks and speech boundaries sat properly within Character tags, improving overall dialogue-span correctness by 35%.
- Cross-referenced and expanded the Character List, updating aliases, gender, and descriptive metadata to keep it consistent and remove false associations.
- Separated spoken dialogue, impersonations, and group speech from narration and inner monologue, and used prior and subsequent chapters to resolve implied speakers.
- Applied QA checklists for tag completeness, character accuracy, and annotation coverage against the Character Dialogue Annotation Guidelines; used project-manager feedback loops to maintain 99%+ labeling precision and rubric compliance and delivered on time using the Argos portal tools.
- Recognized by Argos project leads for data quality and contextual comprehension.

Project: Goodnotes (AI Data Specialist - LLM Evaluation & Red Teaming) – July 2024 - March 2026

- Ran adversarial testing and evaluated user-facing AI features for accuracy, grounding, instruction adherence, consistency, and user experience; identified regressions and issues needing correction or escalation.

- Completed 324 quality reviews and 270 corrections, sustaining roughly 12-15 workflow evaluations per day across selected projects.
- Red-teamed LLM-powered features (Goodnotes AI) using direct and indirect prompt injection and jailbreak techniques, testing whether guardrails and system instructions held under adversarial input.
- Tested agentic workflows, RAG pipelines, enterprise APIs, and tool-calling behavior, including AI search and summarization over user-generated content, probing for unsafe tool use, instruction hijacking through retrieved content, and boundary failures.
- Identified and escalated data-exfiltration risks, documenting the attack path, the model's response, and the impact so engineering could reproduce and triage them.
- Evaluated model behavior across mixed content types such as handwriting, sketches, typed text, and transcribed audio.

Project: Turing (AI Evaluation Analyst) – January 2026 - February 2026

- Conducted adversarial testing with hallucination traps, fact-checked AI answers, identified hallucinations, logical errors, and failures to satisfy task constraints, and wrote justifications for ranking and scoring decisions.
- Reviewed outputs for factual accuracy, logical consistency, risk awareness, and operational realism; identified weak decision logic using rubric-based scoring frameworks.
- Fact-checked claims against reliable sources, including regulatory context, and gave evidence-based corrective recommendations to improve model reasoning.
- Analyzed edge cases and scenario variations to test model robustness across different stakeholder perspectives; documented findings to support iterative improvement of AI reasoning.
- Rubric optimization: identified structural ambiguities in active evaluation rubrics across multi-turn prompt logic; drafted edge-case calibration guidelines adopted by technical pods to standardize criteria.
- RLHF preference ranking: executed fine-grained RLHF preference ranking and structured QC on generative text, supporting model alignment and safety guardrails.
- Golden response benchmarking: authored high-complexity golden-response data points used in model training to help models recognize reasoning flaws and mitigate factual hallucinations.
- Adversarial stress-testing: designed and ran red-teaming prompts to test model guardrails, cataloging edge cases that led to adjustments to the labeling schemas.

Project: Abaka AI (AI Trainer - Multimodal) – October - November 2025

- Conducted structured side-by-side (SxS) evaluations of text-to-image (T2I) generative models using multi-axis rubrics to assess prompt fidelity, semantic consistency, and spatial reasoning.
- Identified and logged subtle model failures, including text-rendering hallucinations, structural anatomy artifacts, and safety policy violations across 400+ complex visual data points.
- Consistently surpassed project quality benchmarks, maintaining a 97%+ audit accuracy rating while adhering to average handling time (AHT) constraints.
- Wrote detailed annotation rationales and step-by-step justifications to directly feed downstream Direct Preference Optimization (DPO) and RLHF fine-tuning pipelines.

Project: micro1 (AI Data Trainer) – September 2025 - November 2025

- Conducted adversarial testing through evaluation scenarios designed to expose weaknesses in model reasoning and task execution; identified hallucinations and systematic response failures.
- Produced structured human feedback for model evaluation, benchmarking, and post-training quality workflows.
- Evaluated AI-generated responses for accuracy, completeness, and adherence to task-specific guidelines; performed side-by-side model comparisons using structured rubrics (task completion, factual correctness, reasoning quality).
- Designed and tested complex reasoning scenarios to evaluate AI decision-making, stakeholder perspectives, and contextual understanding.
- Assessed responses for logical consistency, operational realism, and alignment with real-world professional workflows; identified reasoning gaps and weaknesses in decision logic and risk assessment, and documented findings with structured feedback.
- Inter-annotator agreement: analyzed historical rating discrepancies across 40+ distributed annotators and introduced structured edge-case grading rubrics that increased inter-annotator agreement by 18% across technical and creative language tracks.
- Prompt authoring: authored and stress-tested 250+ complex multi-turn prompts within proctored sandboxes to evaluate model compliance with rule-based constraints, negative constraints, and formatting schemas.
- Error analysis: isolated recurring failure modes through root-cause analysis of model outputs; drafted step-by-step reasoning rationales that directly informed downstream RLHF reward model tuning.
- Quality control: performed secondary data verification and preference-ranking review, auditing 1,500+ data points and correcting misaligned ratings to enforce guideline compliance and protect training dataset integrity.

Project: e2f (Data Annotation Specialist - LLM Evaluation & Safety) – June 2024 - February 2025

- Evaluated LLM-generated responses across five quality dimensions, ensuring dataset consistency for training.
- Evaluated and annotated multimodal AI data across text, image, and video dimensions using quality metrics such as helpfulness, relevance, completeness, and user utility to improve discovery and reasoning accuracy.
- Conducted preference ranking, interactive dialogue evaluations, and retrieval-augmented response verification to assess factual consistency and model grounding.
- Designed and applied persona-based evaluation prompts and multi-turn reasoning scenarios to strengthen contextual alignment and user experience in conversational AI systems.
- Implemented structured scoring frameworks and QA guidelines to ensure classification accuracy, data consistency, and alignment with project-specific benchmarks.
- Performed spatial-temporal and entity recognition analyses in video-based annotation workflows, ensuring precision in reasoning, event sequencing, and contextual understanding.
- Executed content correctness, citation verification, and claim-level accuracy reviews,

identifying hallucinations and reasoning gaps in LLM outputs.
- Collaborated with cross-functional QA teams to enhance annotation standardization, achieving a 20% improvement in inter-annotator agreement and sustaining 99%+ audit precision.
- Consistently exceeded throughput and quality targets, contributing to large-scale data readiness for next-generation model fine-tuning and behavior evaluation.

Project: SuperAnnotate (LLM Data Trainer) – May 2024 - June 2024

- Used the SuperAnnotate platform to design structured prompts and responses for LLM behavior training across diverse reasoning and summarization tasks.
- Trained and evaluated content classification models using sourced and curated data to enhance factuality, helpfulness, and user relevance.
- Created and refined multi-turn conversational flows, improving dialogue naturalness and persona coherence for interactive AI assistants.
- Authored internal annotation and prompt-design standards, ensuring consistency in tone, response formatting, and reasoning fidelity.
- Collaborated cross-functionally to enhance data quality pipelines, achieving measurable gains in model consistency and fine-tuning readiness.

Project: Welocalize (Swahili AI Quality & Evaluation Contributor, Lyra Project) – Project-Based

- Reviewed Swahili AI-generated content for linguistic correctness, naturalness, cultural appropriateness, and instruction compliance; audited other evaluators' judgments and gave correction feedback.
- Conducted side-by-side (SxS) and blind A/B preference testing on Swahili-language LLM outputs, judging variants on grammatical syntax, semantic flow, and regional naturalness.
- Engineered complex multi-turn conversational scenarios and adversarial prompts in Swahili to stress-test the model's linguistic reasoning, instruction adherence, and safety guardrails.
- Identified and documented localized failure modes, including Swahili noun-class mismatches, factual hallucinations, and cultural nuances specific to the East African target audience.
- Wrote clear, evidence-based rationales defending scoring decisions against multi-axis rubrics, providing feedback loops to tune downstream reward models.
- Maintained a 98%+ quality audit score across high-volume review batches, consistently exceeding daily throughput targets within the internal annotation ecosystem.

Earlier Data Annotation & Quality Experience

Data Labeler (Internal Reviewer) | Focal Systems | Remote | February 2021 - November 2023

- Enhanced retail automation AI systems by reviewing more than 2 million images used to train computer vision models, covering products, compliance patterns, and inventory data.
- Conducted high-precision QA and internal review cycles, improving accuracy for deep

learning models used in retail digitization.
- Designed annotation validation workflows that reduced classification turnaround time by 25% while maintaining 98%+ audit accuracy.
- Improved product detection pipelines by refining object localization and visual classification standards, supporting scalable commercial deployments.
- Collaborated with data scientists and engineers to establish feedback-driven retraining loops, driving sustained model accuracy improvements.

Medical Data Annotator | RetinAI Medical | Remote | February 2022 - May 2022

- Annotated and validated large-scale medical datasets for computer vision models supporting ophthalmology and diagnostic AI research.
- Classified clinical imaging and textual data with precision, achieving high inter-annotator reliability across complex medical attributes.
- Validated content classification outputs against medical accuracy benchmarks, ensuring compliance with healthcare data standards.
- Identified critical diagnostic trends within datasets to support model retraining, improving performance in early disease detection.
- Contributed to model pipeline readiness, ensuring datasets met regulatory and quality thresholds for integration into healthcare workflows.

Map Data Annotator | Gatik | Remote | June 2020 - June 2021 (concurrent project-based contracts)

- Annotated high volumes of geospatial and navigation imagery to support autonomous vehicle perception models.
- Delivered precise labeling of road features, lane markings, and environmental cues, boosting model navigation reliability.
- Applied QA protocols and multi-tier accuracy reviews, achieving consistent alignment with safety-critical annotation benchmarks.
- Collaborated with machine learning engineers to improve map data validation frameworks, enhancing the efficiency of training datasets.
- Maintained top-tier productivity and accuracy metrics, leading to additional project assignments within the annotation pipeline.

Data Labeler | Enlabeler | Remote | August 2020 - February 2021 (concurrent project-based contracts)

- Labeled and classified large-scale multilingual datasets for machine learning models across visual and text-based content domains.
- Implemented QA and verification standards to ensure balanced dataset representation and model fairness across content types.
- Streamlined internal labeling workflows, reducing redundancy and improving annotation throughput by 20%.
- Collaborated with global data teams to align classification outputs with client-specific taxonomies and domain ontologies.
- Recognized for precision and consistency in early-stage AI model development across diverse labeling projects.

Data Annotation & Quality Operations | CloudFactory | Hybrid | June 2018 - November 2020 (concurrent project-based contracts)

- Supported Just Appraised's AI-driven property and document automation workflows, annotating and validating data used to enhance record digitization for county assessors and real estate documentation.
- Processed and reviewed land deeds, property transfers, permits, and indexing data, improving document recognition accuracy and classification precision by 28% through refined metadata tagging.
- Used Hudl and in-house annotation tools to classify structured and unstructured data, ensuring compliance with Just Appraised's domain-specific taxonomies and legal indexing requirements.
- Identified and corrected metadata inconsistencies across thousands of property records, contributing to a 35% reduction in downstream error propagation during AI model training and validation.
- Collaborated with data engineers and QA reviewers to streamline validation workflows, achieving 99%+ labeling accuracy and meeting weekly throughput targets for bulk document ingestion.
- Trained new annotators on document classification standards, entity linking, and OCR-based validation protocols, improving cross-team quality alignment by 25%.
- Delivered high-quality annotation outputs under tight turnaround times for local government automation projects supporting over 300 U.S. county clients.
- Recognized by CloudFactory project leads for excellence in data integrity, turnaround efficiency, and proactive error detection within Just Appraised's automation pipelines.

Data Annotation Specialist (NLP) | Tagtog | Remote | January 2020 - March 2020 (concurrent project-based contracts)

- Annotated large volumes of natural language text to create structured datasets for NLP and semantic search models.
- Enhanced content categorization accuracy through detailed entity recognition, relation mapping, and linguistic context tagging.
- Contributed to model refinement and retraining cycles, ensuring dataset diversity and alignment with language model benchmarks.
- Built an extensive, high-quality text corpus that accelerated NLP model tuning and improved classification and search relevance.
- Collaborated cross-functionally with linguists and data scientists to optimize annotation workflows and ensure consistent project delivery.

Data Annotator | Humainly | Remote | July 2019 - November 2019 (concurrent project-based contracts)

- Labeled and classified high-volume visual datasets to train AI models for content recognition, discovery, and recommendation systems.
- Improved annotation efficiency and throughput by refining labeling workflows and establishing consistency across multiple task categories.
- Applied rigorous QA checks to ensure data integrity, increasing model performance

accuracy in production environments.
- Contributed to the scaling of annotation operations by optimizing task segmentation and automation readiness.
- Maintained project deadlines with high accuracy, earning recognition for reliability and consistency across multi-region teams.

Education

- Master's in Artificial Intelligence (in progress) | American Global Technical University | Coursework in AI, machine learning, and computational reasoning
- Bachelor of Arts in Sociology, Criminology & Community Development | Rongo University | 2013 - 2017 | Second Class Honors, Upper Division

Certifications and Affiliations

- Certified AI Security Professional (CAISP), Practical DevSecOps | Awarded March 2026
- Anyone AI Expert Network, Approved Expert Member | 2026

Tools and Languages

- LLMs: ChatGPT, Claude, Gemini
- Platforms: Labelbox, Dataloop, SuperAnnotate, Tagtog, Scale AI, Appen, proprietary evaluation platforms
- Data and collaboration: Python, basic SQL, Microsoft Excel, Google Sheets, Airtable, Jira, Asana, Notion, Slack
- Languages: English (native), Swahili (fluent), French (professional proficiency)
